

About the Book

AI can now explain, draft, summarize, calculate, and code. That does not make teachers less important. It changes the evidence of learning and raises the level of judgment expected from every STEM educator.

The Teacher Above AI synthesizes the International STEM Skills Round Table Phase III into a professional compass for education in the age of generative AI. It follows the discussion across competencies, assessment, teacher roles, AI-supported learning, professional development, and the learning environments that connect schools, higher education, and industry.

The book's central claim is direct: human judgment must remain above the machine. Teachers design the conditions for responsible learning. Students keep responsibility for thinking. AI supports the work, but does not govern it.

A synthesis by Avi Salmon. Not an official publication of the Samuel Neaman Institute or any organization represented in the Round Table.
